

# Linux Kung Fu

Ross Ventresca  
UBNetDef, Fall 2017

GOTO: <https://apps.ubnetdef.org/>

# What is Linux?

- ◆ Linux generally refers to a group of Unix-like free and open source operating system distributions built around the Linux kernel
- ◆ A typical Linux distribution comprises a Linux kernel, GNU tool and libraries, additional software, documentation and desktop environment
- ◆ Some might use their own package managers

# Over 500 distributions!

# AN INTRODUCTION TO THE LINUX TERMINAL

# Terminal, Command Line, and Shell

- ◆ To simply put it the terminal is the text input/output environment.
- ◆ The command line is an interface where the user types the command and presses the enter key to execute the command
- ◆ The shell is the primary interface that interprets the commands that get entered in.
- ◆ Most Linux distributions have Bash as their shell, but others exist as well.

# The Terminal

- ◆ `you@ubnetdef:~$`
  - Username: you
  - Host name: ubnetdef
  - Current working directory: ~
  - Superuser: No(\$)
- ◆ `root@universe:/etc/init.d#`
  - Username: root
  - Host name: universe
  - Current working directory: /etc/init.d
  - Superuser: Yes (#)

# Format of Commands

- ◆ To execute a command, type its name and arguments at the commands line
- ◆ Usually commands follow this format

# Editing files in the terminal

- ◆ In order to manipulate files from the terminal you need a command line editor.
- ◆ Popular Editors
  - ◆ Nano
  - ◆ Vi/Vim
  - ◆ Emacs

                        tW88D
```

# Working With Directories and Files

# \$ pwd

- ◆ The pwd (print working directory) command displays the name of the current working directory
- ◆ It tells you where you currently are in the file system
- ◆ `$rossvent@ubnetdef:~$ pwd`
  - `/home/rossvent`

# \$echo

- ◆ Echo allows a user to repeat, or “echo” text to standard output
- `$rossvent@ubnetdef:~$ echo Hello World`  
Hello World
- ◆ Useful for scripting
- ◆ Can also be redirected
- `$rossvent@ubnetdef:~$ echo "Appending to file" > redirect.txt`

# \$ls

- ◆ The ls command lists files and directories within the current working directory

```
-$ls
```

- ◆ It can also list contents with a specified path

```
-$ls /etc
```

- ◆ To include hidden entries

```
-$ls -a
```

- ◆ To display more information

```
-$ls -l
```

- ◆ You can even sort the list!

```
-$ls -S
```

# \$cd

- ◆ Changes the current directory in Linux.

```
$cd /var/log
```

- ◆ Goes to the root directory regardless of location (Absolute path)

```
$cd /
```

Goes to the parent of the current working directory

```
$cd ..
```

Goes to home directory

```
$cd ~
```

Can navigate to folders relative to current working directory

# \$cat

- ◆ Displays the contents of a file or files on the terminal

```
$cat /etc/motd
```

- ◆ cat can also conCATenate or “glue together” two or more files

```
$cat file1 file2 file3
```

- ◆ Can also be redirected to a new file.

```
$cat file1 file2 file3 > bigfile
```

- ◆ Also appended to a file!

```
$cat file4 >> bigfile
```

# \$more

- ◆ Allows you to display output in the terminal one page at a time
- ◆ When the text passed to it is too large to fit one screen it pages it. You can scroll down through files but not back up!

# \$less

- ◆ Actually more useful than the more command!
- ◆ Written by a man who was fed up with more's inability to scroll backwards
- ◆ Supports any type of file that supports scrolling
- ◆ Can customize to open any type of file

# \$mkdir

- ◆ The command is used to make a new directory

```
$mkdir name_of_directory
```

- ◆ Can also make all directories leading up to the target directory if needed

```
$mkdir -p /tmp/a/b/c
```

# \$rm

- ◆ The rm command removes files or directories

- ◆ To remove a file:

```
$rm file.txt
```

- ◆ To remove any directory including all the files inside

```
$rm -rf delete_me/
```

- ◆ To remove an empty directory

```
$ rmdir empty_dir
```

- ◆ **Be very careful using the rm command**, as it doesn't prompt you to confirm deletion.

And NEVER type `rm -rf/`

# \$ man

- ◆ The man command is used to format and display the man pages or the manual
- ◆ Provides extensive documentation about specified command

```
$man ls
```

```
$man man
```

# Processes

# \$ps

- ◆ The ps (process status) command is used to provide information about the currently running processes. Each processes has a unique identification numbers (PID)

```
$ps
```

- ◆ The aux option provides a more detailed list of processes.

```
$ps aux
```

# \$top

- ◆ Similar to ps, but is interactive and updates every second
- ◆ A similar utility, htop, provides a similar function, but usually needs to be installed first

# \$kill

- ◆ Asks a process to shut down nicely

```
$ kill <pid>
```

- ◆ If it is being unresponsive, the kernel can decide to take matters into his own hands

```
$kill -9 <pid>
```

```
$kill -KILL <pid>
```

```
$kill -SIGKILL <pid>
```

# Services

- ◆ In Linux, services are applications or processes that run in the background
- ◆ They are sometimes referred to as daemons

# Services

- ◆ There are two main ways to control services

- System V (older)
- systemd (newer)

- ◆ SystemV

```
#service <name> <start | stop | restart | reload | status>
```

```
#service apache status
```

- ◆ systemd

```
#systemctl <start | stop | restart | reload | status> <name>
```

```
#systemctl reload nginx
```

# User Management

- ◆ Linux is a multi-user operating system in that it allows multiple users on different computers or terminals to access a single system.

# Users and Groups

- ◆ Create a user account

```
#adduser <username>
```

- ◆ Create a group

```
#addgroup <groupname>
```

- ◆ Add a user to a group

```
#usermod -G <groupname> -a <username>
```

# Users and Groups

- ◆ See all groups a user is in:

```
$groups
```

```
$groups <username>
```

- ◆ See more information about a user:

```
$ id
```

```
$ id <username>
```

- ◆ See the following files:

```
$less /etc/passwd
```

```
$less /etc/groups
```

# \$passwd

- ◆ The passwd command allows changing the passwords of user accounts
- ◆ Changing user passwords:  

```
$passwd
```

```
#passwd <username>
```
- ◆ Locking and unlocking user accounts:  

```
#passwd -l <username>
```

```
#passwd -u <username>
```
- ◆ The passwords are stored as hashes in the file /etc/shadow

# \$su

- ◆ The su command allows you to switch user
- ◆ If no username is specified, the superuser account (root) will be used by default

# \$sudo

- ◆ Allows permitted users to execute a command as the superuser (i.e “superuser do”) or another user (if specified)
- ◆ Configured in the file `/etc/sudoers` (can be edited with the `visudo` command)

`#visudo`

# Networking

# \$ifconfig

- ◆ The ifconfig command can be used to view or configure network interfaces

- ◆ View all interfaces:

```
$ ifconfig
```

- ◆ View specific interface:

```
$ ifconfig <interface-name>
```

- ◆ Bring an interface online or offline (respectively):

```
# ifconfig <interface-name> <up | down>
```

# \$ping

- ◆ The ping command sends an ICMP ECHO\_REQUEST to network hosts.
- ◆ Pinging IP addresses is usually a simple way to check if your internet connection is working

```
$ ping 8.8.8.8
```

# Package Managing

- ◆ Package managers can help with automating common tasks such as installing, upgrading, and uninstalling programs or packages.
- ◆ Examples:
  - apt (Advanced Packaging Tool)
  - aptitude
  - dpkg
  - yum
  - dnf

# \$apt

- ◆ Update the local package index:  
# apt update
- ◆ Upgrade a package  
# apt upgrade <package-name>
- ◆ Upgrade all packages:  
# apt upgrade

# \$apt

- ◆ Install a package

```
#apt install <package-name>
```

- ◆ Uninstall a package (leave configuration)

```
#apt uninstall <package-name>
```

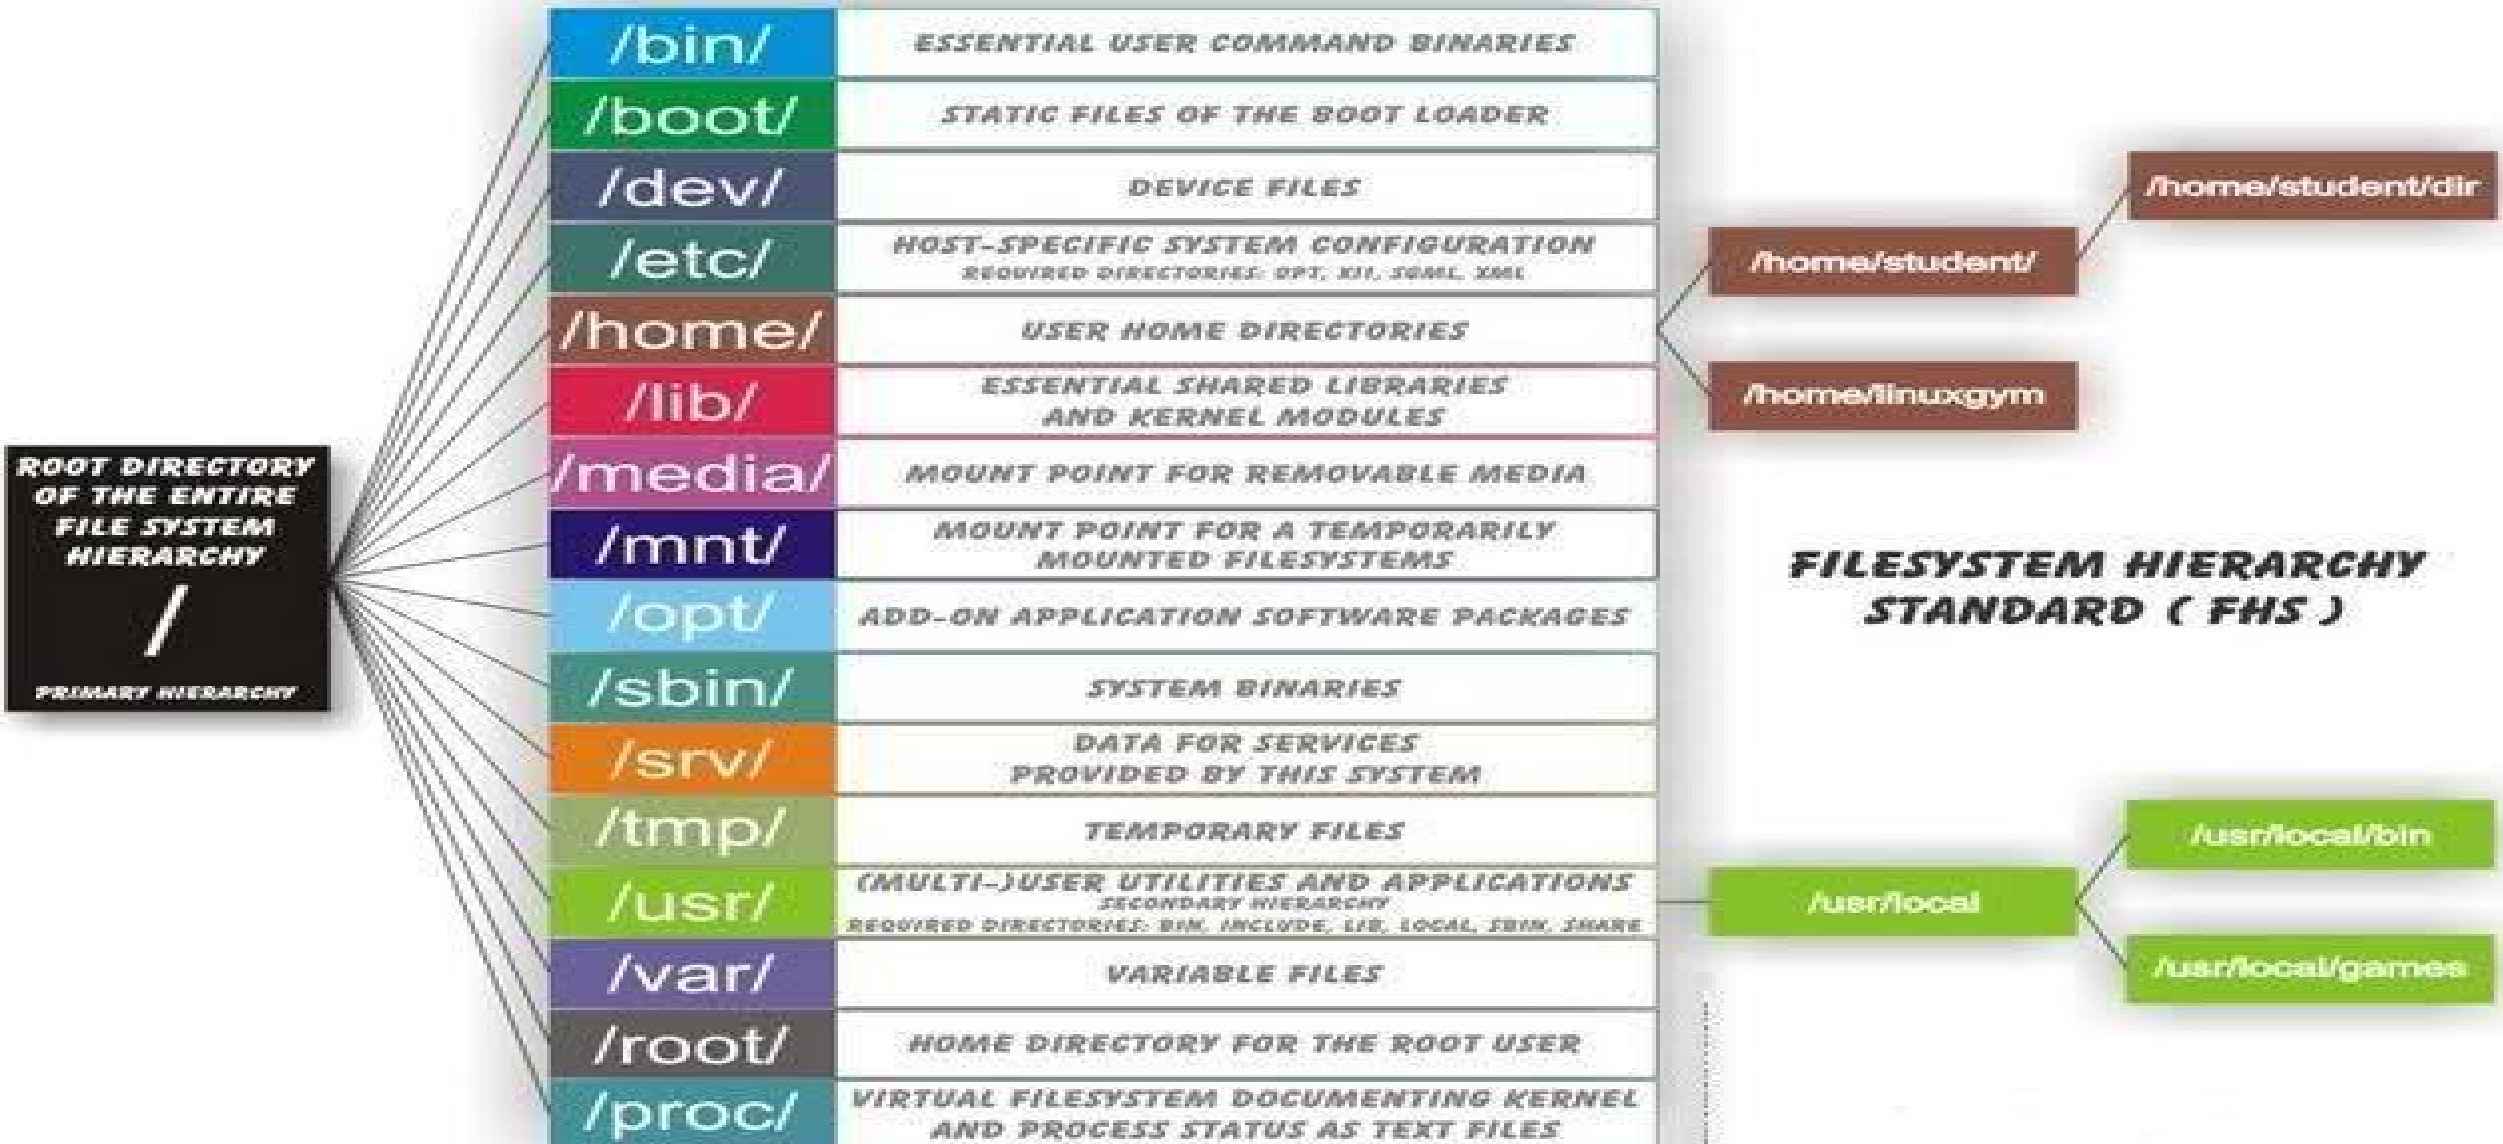

- ◆ Uninstall a package (remove configuration)

```
#apt purge <package-name>
```

- ◆ Uninstall unneeded dependencies:

```
#apt autoremove
```

# Directory Structure

# Useful tips and tricks

- ◆ Pressing the up arrow recalls the previous command
- ◆ Pressing tab while typing a command can sometimes help to autocomplete a command's name or a file/directory path
- ◆ If you need to stop a currently-running command, use Ctrl+C
- ◆ Typing “!!” in the terminal will re-run the last command
- ◆ If you accidentally print the contents of a binary file to the terminal, it may affect the terminal display. The “reset” command can be used to resolve that issue.
